

CYBER SECURITY INTERNSHIP

Phishing Awareness Program

Prepared by: Moin Darvesh

CodSoft Cyber Security Internship

01 · THE BASICS

Phishing tricks people into giving away information

Phishing is a fake message, website, or call designed to steal data or money.

Fake bank email

“Confirm” your account.

Fraudulent delivery

Request a small fee.

Fake login page

Copy a trusted service.

02 · PAUSE POINTS

Five warning signs deserve a pause

One sign may be enough to stop and verify.

Unusual sender

Address looks unusual or misspelled.

Urgency or fear

Message creates urgency or fear.

Unexpected attachment

An unexpected attachment appears.

Strange link

Link looks strange or does not match the sender.

Secret request

Someone asks for a password, PIN, or OTP.

03 · VERIFY

Read the message, then verify the destination

Fictional example: “Your account will be locked today. Confirm now to avoid interruption.”

Sender: security@paypa1-alert.example

Warning: urgency, an unfamiliar sender, and “paypa1” (number 1, not the real brand spelling).

Never enter credentials via an unexpected message. Verify in the official app or type the known website address yourself—not the message link.

1. Suspicious Message
2. Inspect Sender
3. Open Official App

04 · HUMAN EMOTION

Social engineering targets human emotions

Social engineering means manipulating people so they act before thinking.

Impersonation

“I’m your manager—send the file now.”

Fear

“Suspicious activity was detected.”

Curiosity

“See the private photos here.”

Urgency

“Pay within 10 minutes or lose access.”

The tactic changes; the goal is to make you act before thinking.

05 · DELIVERY SCAM

A small parcel fee can hide a big scam

01

A fictional delivery text says a parcel is delayed.

02

It asks for a small “redelivery fee” through a link.

03

The link opens a fake payment page that captures card details.

Avoid it: check tracking in the retailer’s official app or website, contact the courier independently, and delete the message.

06 · DAILY HABITS

Build habits that block phishing

Small checks turn a suspicious message into a safe decision.

- Check the sender and message context
- Verify websites independently
- Never share passwords, PINs, or OTPs
- Enable multi-factor authentication
- Update software and browsers
- Report suspicious messages, then delete them

07 · QUICK QUIZ

Quiz: stop, check, verify

01 Which is a warning sign?

A) Unexpected urgency B) A known bookmark C) A routine update. **Answer: A**

---

02 Where should you enter a password after a suspicious message?

A) Its link B) A shortened link C) The official app or typed address. **Answer: C**

---

03 What should never be shared?

A) An OTP B) A public help article C) A software version. **Answer: A**

Before clicking: Stop. Check. Verify.
